

4.

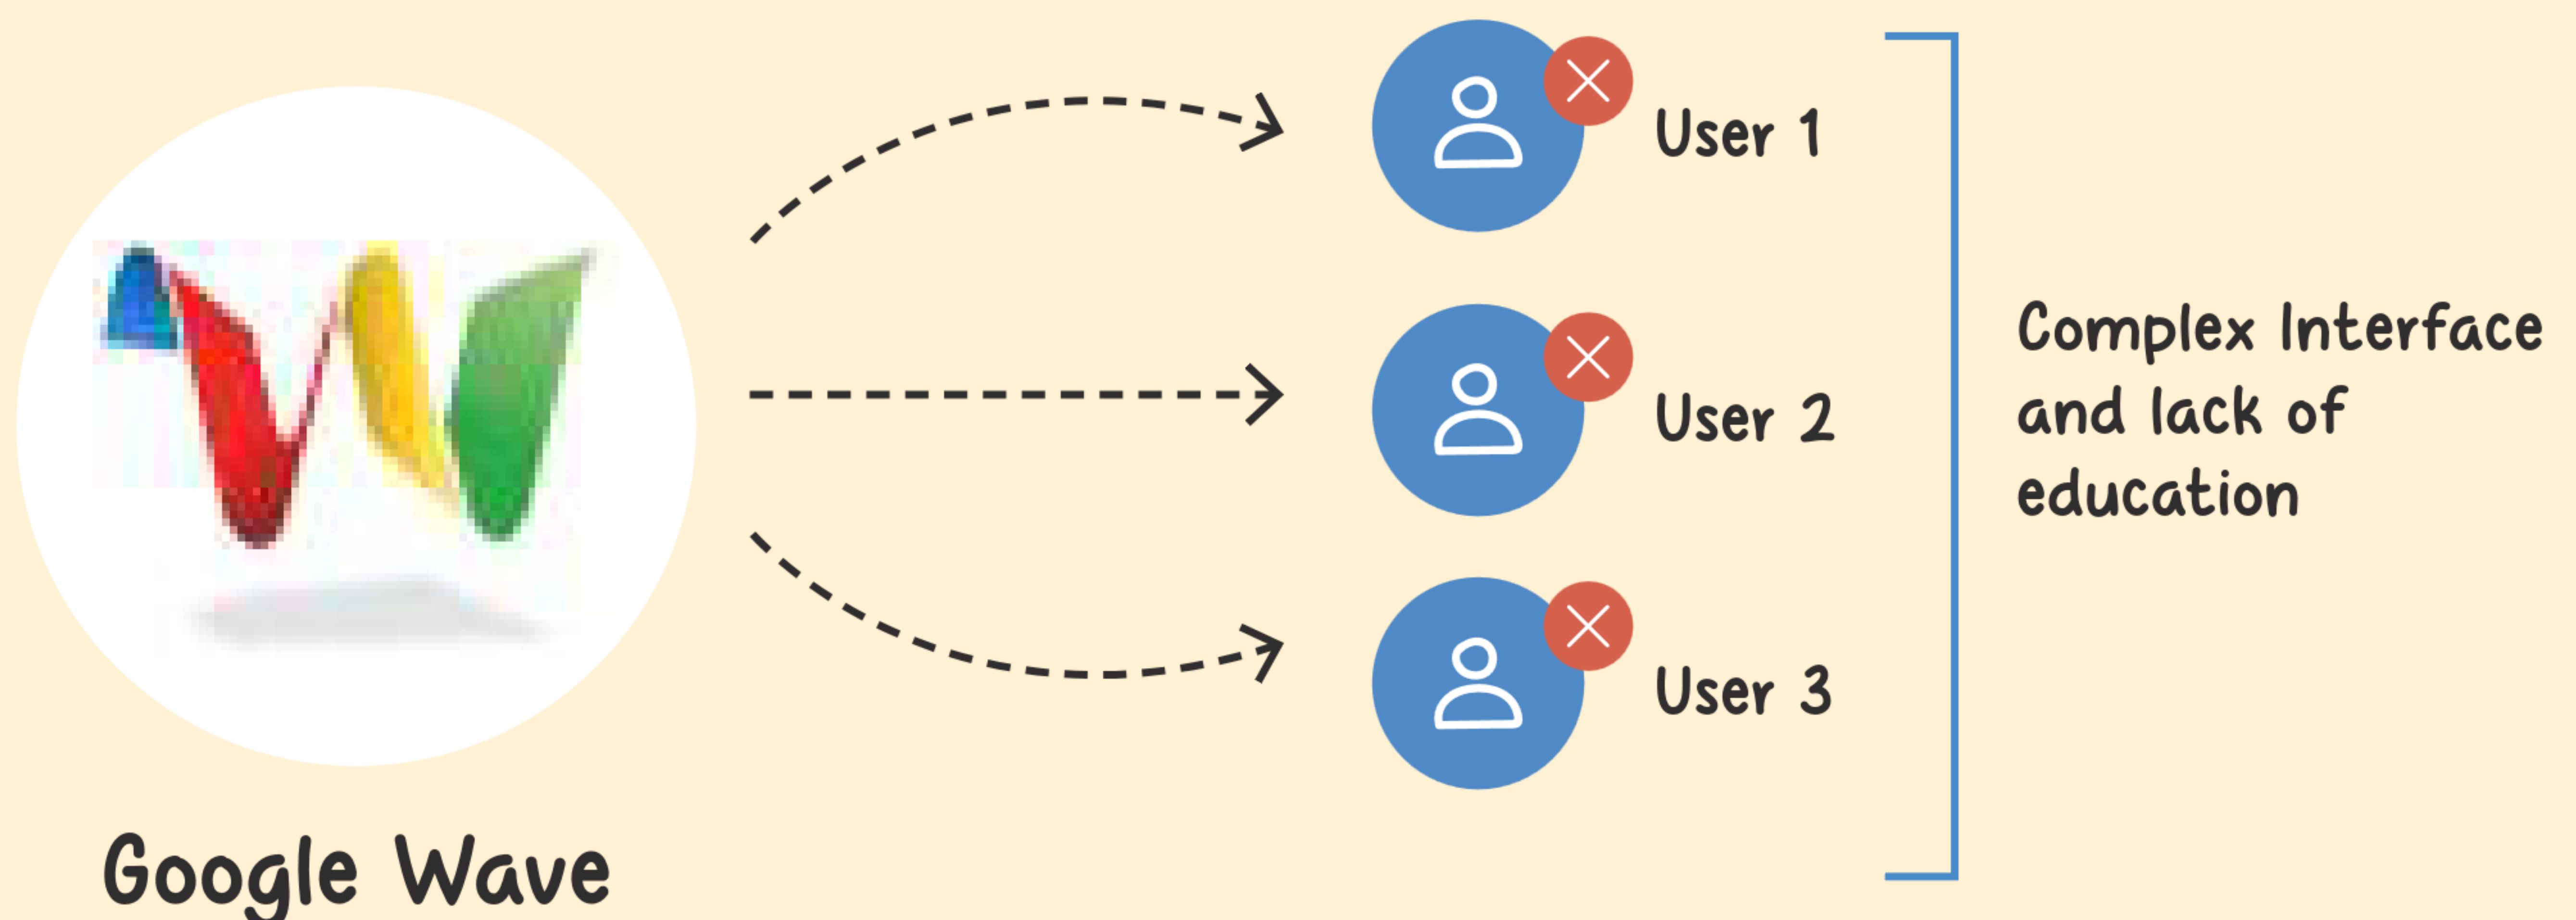

Lack of Consumer Awareness Because of a Relatively Newer Concept

When introducing a new concept or technology to the market, educating consumers is essential. If consumers don't understand the value proposition or how the product solves their problems, the launch is likely to fail.

While Google is a tech giant, many of you might not have heard about one of its lesser-known launches - **Google Wave**. Launched in 2009, Google Wave was a real-time communication and collaboration tool that combined features of email, instant messaging, wikis, and social networking. **Sounds innovative, right?**

Unfortunately, it was a concept that people found hard to grasp.

Despite innovative features, complex interface left users confused. Google Wave was an ambitious project, but Google didn't effectively educate users on how to use the platform and the benefits it offered.

The interface was complex, and many users struggled to understand its purpose or how it could fit into their daily workflow. Despite the initial hype, confusion and lack of clear communication about its use led to poor adoption and eventual discontinuation.
