

3. Neuromarketing - New Wave of Strategic Marketing, Advertising and Promoting Your Product

Neuromarketing employs technologies such as functional magnetic resonance imaging (MRI) and electroencephalography (EEG). It takes place in both controlled lab environments and real-world settings. In labs, tools measure brain activity in response to marketing stimuli. In contrast, real-world studies track consumer behavior in stores, on websites, or through live advertising campaigns to understand how marketing influences decision-making in natural settings.

This helps to understand the consumer's behaviour and accordingly design strategies to better connect on a subconscious level.

Some big brands like [Netflix](#) use neuromarketing to grow their business and keep customers coming back. Even though we think we make decisions consciously when buying things, a lot of it actually happens without us even realising it.

With all the technology around us like pop-up ads and messages it's difficult to avoid being affected by it. These things can change how we feel about a brand or whether we decide to buy something in just a second.

You can use some of these marketing techniques used by established brands in your own strategies.
