

Startupology

Hence, all this can lead to customer frustration, ultimately impacting customer satisfaction negatively. If customers are less likely to return, it can damage your brand's reputation and reduce customer loyalty. Therefore, it's crucial to have a strategy that is easily accessible to your target audience.

Let me take you to the case study. I am sure you must have at least one person in your circle who was going crazy about the PS5 launch.

Think about the last time you needed groceries in a hurry. That's where Zepto, the 10-minute delivery startup, comes in.

Zepto promised super-fast grocery delivery, which wasn't easy to pull off. With thousands of orders coming in every minute, they faced significant supply chain hurdles like stock running out, delays in restocking, and delivery slowdowns. Customers expected groceries instantly, but even minor hiccups led to frustration.

To fix this, Zepto set up dark stores and small, local warehouses packed with essential items. They used AI to predict demand, making sure popular products were available. Their delivery network was fine-tuned to reduce delays, helping them keep their 10-minute promise.

This shows why distribution and supply chain planning are crucial. Get it right, and customers love you. Get it wrong, and they leave.
