

D. Dual

Dual distribution occurs when manufacturers sell their products both directly to consumers and through intermediaries or retailers. This strategy enables them to reach a wider audience while maintaining control over certain aspects of their sales process.

For example, a company might sell its products online through its website while also distributing them through specialised retailers. This approach offers the benefits of both direct sales and selective distribution, increasing customer reach.

Let's take Nike as real life example.

Direct Channel: Nike sells directly to consumers via its own flagship stores, e-commerce website, and mobile app (e.g., Nike.com and the SNKRS app).

Indirect Channel: Nike also sells through intermediaries such as retail partners like Foot Locker, JD Sports, and department stores.
