

New brands benefit from this B2B2C model. Partnering with these allies helps them reach more customers quickly.

How does this model actually work? Let's look at a service that we all are familiar with: Apple's App Store.

In the B2B2C model, Apple acts as the B2B entity, providing a platform (the App Store) where developers (B1) can sell their applications directly to consumers (C).

Here's how it works:

➡ **B1 (Developers):** Developers create and submit their applications (apps) to the App Store. Once approved, these apps are listed for sale or free download on the platform.

➡ **B2B (Apple):** Apple operates the App Store, which serves as a marketplace for developers to distribute their apps. Apple provides the platform, handles transactions, and sets guidelines and policies for app submissions. Apple also ensures quality and security. In addition, Apple offers visibility and marketing tools for developers.

➡ **B2C (Consumers):** Consumers (users of Apple devices like iPhones and iPads) browse the App Store, discover apps, and purchase or download them directly to their devices. A commission fee of 30% for most purchases must be paid to Apple.

This model benefits developers (B1) by offering a large audience and distribution tools, Apple (B2) by earning commissions and retaining users in the ecosystem, and consumers (C) by providing access to a curated, secure app marketplace.
