

Business-to-Customer (B2C) Models

In this model, service aggregators are involved, and businesses sell their services directly to individual consumers through intermediary platforms or service aggregators.

A. Service through a Service Aggregator

Educators expand their reach by offering courses through platforms like Coursera. By partnering with such intermediaries, they gain access to a wider audience while leveraging the platform's infrastructure for course delivery, marketing, and engagement.

B. Retail Stores

Businesses sell products through retail chains like Walmart and Target, reaching consumers through physical stores and online platforms. Retail partnerships help brands scale by offering wide distribution, competitive pricing, and a seamless shopping experience, making products accessible to a larger customer base.
