

Make Iteration Timeliness

When you're developing a product, it's important to improve it over time through iterations. To do this effectively, you need to plan out how much time you'll spend on each iteration cycle. First, understand your market and its behaviour patterns.

Consider factors like geographical location and seasonal changes that might impact customer preferences. Identify customer behaviour, shifts in trends, and preferences for needs. Then, set an iteration timeline; it could be monthly, quarterly, or at other intervals. Ensure you have the necessary resources, like time, manpower, and budget. Following this approach, you can improve the product.

Focus on Key Features

Identify key features of your product that are necessary for business success and growth and that directly contribute to sales. Features that are scalable and can adapt to future changes should be prioritised. Implement the important features first, and then add additional functionalities based on user feedback and market demand.
