

Core Benefit

The core benefit is the primary reason a customer chooses to buy a product. It addresses the fundamental problem or need the product aims to solve. Essentially, it answers the question: Why would someone want your product? Because it directly solves a problem or fulfills a specific need the customer has.

For example, a smart phone has many features and functions; its core benefit is communication. People start connecting with others through calls, messages, emails, and social media. Similarly, if you purchase a camera, its core benefit is capturing memories and moments. Hence, their core benefit helps businesses to focus on marketing efforts and differentiating their products in the marketplace.

Core Functions: Communication

Generic Product

The basic product level takes the core benefit of a product and converts it into something physical or tangible that customers can interact with. It involves identifying important elements that are necessary to deliver the core benefit to the customer. The product must meet minimum requirements to fulfill its purpose and provide value to the customer.

Continuing with the smart phone example, the basic product level includes the physical device and functionalities such as sending messages and applications such as calculators or calendars. These are essential functions that enable smart phones to serve their primary purpose of communication. Hence, basic product levels can help businesses meet the fundamental needs of their customers.
