

## Expected Product

It focuses on meeting the customer's expectations for a product. It includes additional features and qualities beyond the basic functionalities provided at the basic product level. These features are considered essential for customer satisfaction. Thus, meeting expectations helps prevent customer dissatisfaction.

Using the smart phone example again, expected product features might include decent battery life, a clear and vibrant display, a responsive touch screen, and a user-friendly interface. These are features that customers expect from smart phones and would be disappointed if they were lacking. Businesses should try to exceed these expectations by improving their products and services. Hence, the product delivers quality that meets or exceeds customer expectations.
