

Direct Cost

These are expenses that are directly related to the production or delivery of products or services. These expenses are the core operations of the business. Examples of direct costs include raw materials used in manufacturing, packaging materials, and direct labour costs.

Indirect Cost

Indirect costs, also known as overhead costs, are expenses that support the overall business operations and its continuity. Examples of indirect costs include stationery, maintenance and repair expenses, marketing and advertising campaigns, employee benefits such as health insurance and retirement plans, electricity and internet services, and administrative salaries.

9. Revenue Streams

Revenue streams represent the different sources of income for a company and assess how revenue is generated from each customer segment. What pricing strategy do you use? What are your main revenue sources? This helps determine how products and services are priced to maximize profitability.

Diversifying Revenue Streams

It involves integrating additional revenue streams into a company's business model to enhance overall income and mitigate risk. This approach parallels portfolio diversification in investing, where distributing risk across multiple assets helps minimize potential losses.
