2. Unit Economics

Unit economics is the analysis of the prices related to a single unit of a product or service sold by a business. It helps to understand the pricing structure of a product or service. Understanding this is a little bit complex, but it comes with a formula. It involves analysing three key metrics: **lifetime value (LTV)**, **churn rate**, and **customer acquisition cost (CAC)**.

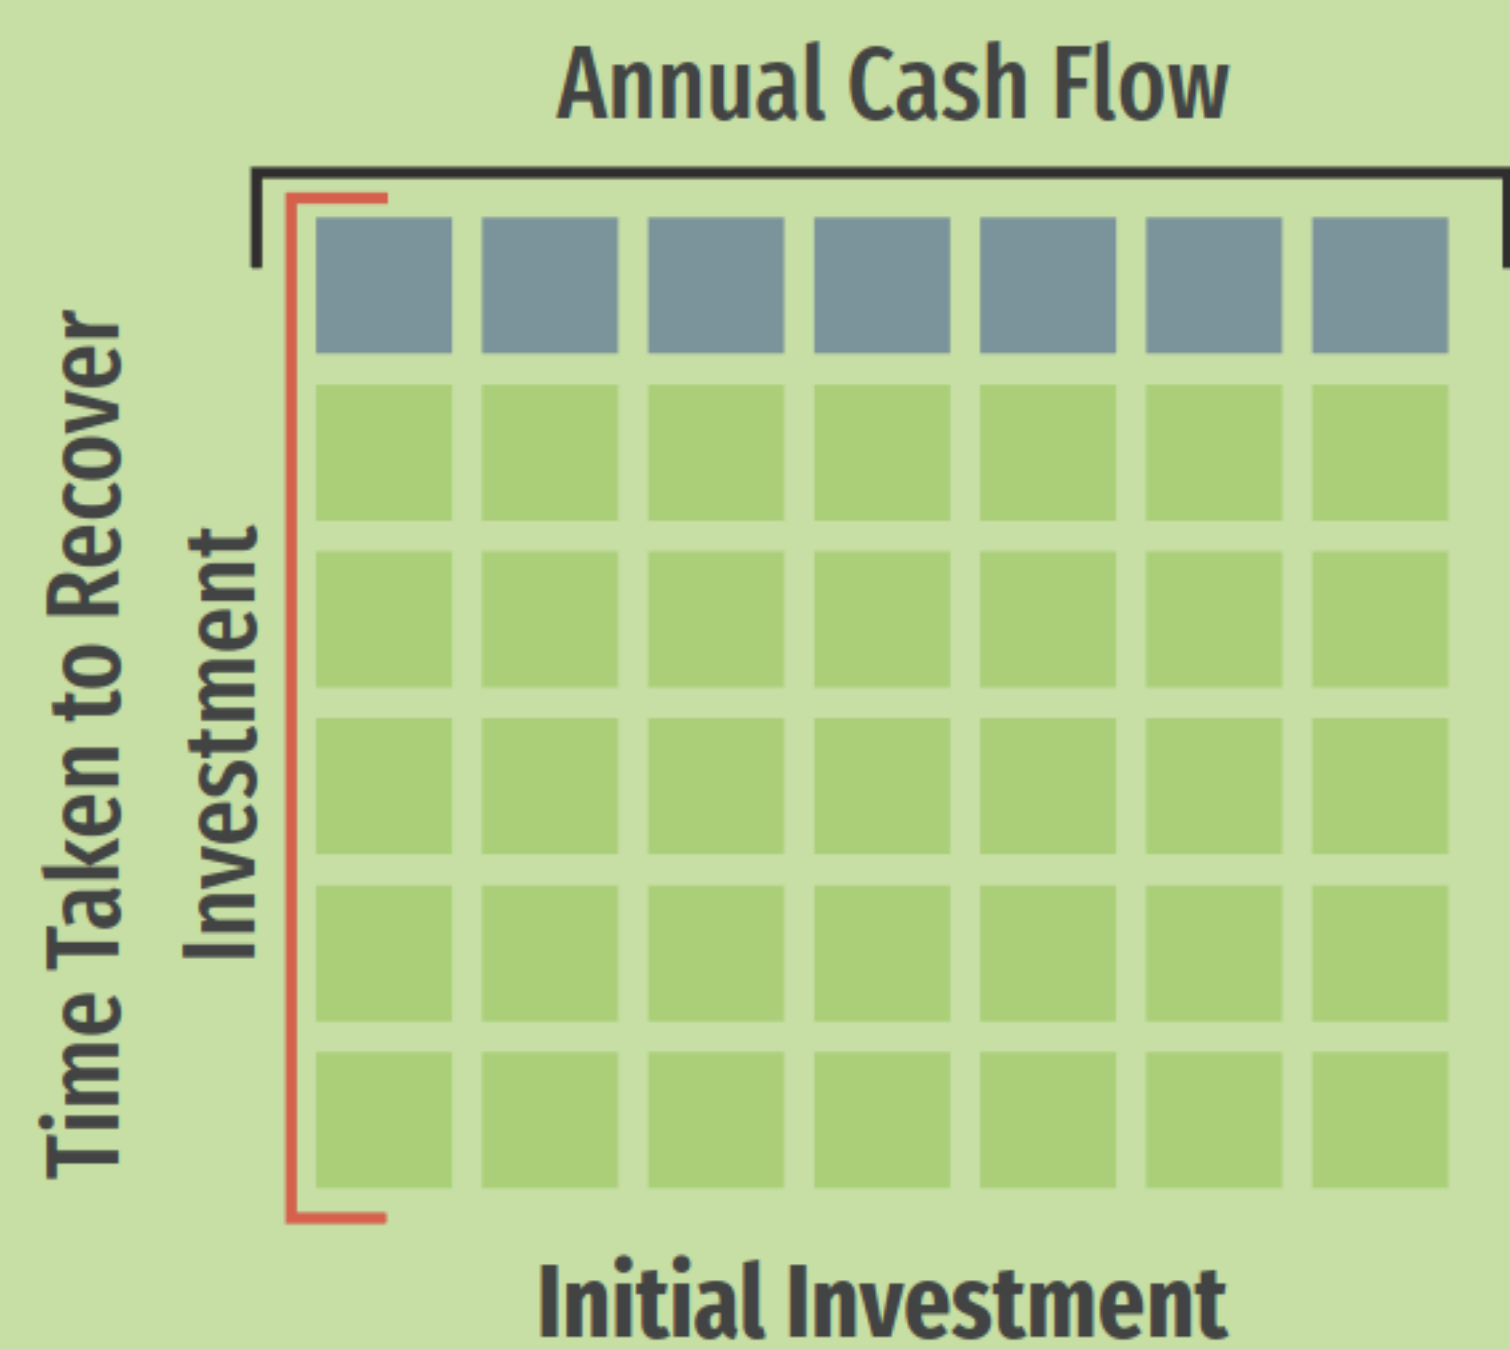

A key metric for unit economics is expressed as LTV/CAC. A ratio of 3 or higher represents a healthy business model. Your aim should be at 2.5 or more to ensure profitability and sustainability. This indicates that the business is generating enough value from its customers to cover its acquisition costs and generate profit.

Customer Acquisition Cost (CAC), which measures the cost of acquiring new customers

Customer lifetime value (CLTV), which estimates the total revenue a customer is expected to generate over their lifetime with the company

The payback period, which indicates the time it takes for the company to recover its initial investment

7.4 Technology Integration to Streamline Processes

In today's fast-paced world of technology and innovation, integrating technology into business processes is essential for several reasons. Automation is to automate repetitive tasks, which reduces the need for human or manual intervention. This can help businesses optimise resource allocation, achieving more with fewer resources. It enables faster execution, leading to time savings. It also leads to fewer errors compared to manual methods, improving customer satisfaction.

Technology integration offers numerous benefits, from streamlining operations to generating new revenue streams. Advanced technologies like AI enable the analysis of large datasets in a structured way, cloud computing provides scalable computing resources, and automation executes repetitive tasks based on these insights, all while offering real-time access to data and analytics.
