

9.3 Decision Making Approaches

1. Rational Decision Making Model

The Rational Decision-Making Model prioritizes logic and data over emotions, aiming to reduce biases that can influence judgment. Emotions, as part of human behavior, often lead to subjective decision-making. This model ensures choices are grounded in reason rather than impulses, minimizing emotional bias and promoting sound, objective decisions.

Verifying and Defining the Problem

Identifying and verifying the problem is the first step in rational decision-making. For example, a manufacturing company facing inconsistent product quality must determine the root cause. In this case, the issue may stem from variations in raw material quality.

Once the problem is clearly defined, the company can develop effective solutions to enhance product consistency and quality.
