

Here's how you can apply it as an entrepreneur.

Understand Interconnectivity

Imagine a spider's web. Each strand is connected to others, forming a complex network. Systems work similarly. Every part of a system, whether it's people, processes, or resources, is like a strand in the web.

When one part can or is affected, it sends ripples throughout the entire system, impacting other parts. Systems thinking helps us see these connections and understand how they shape outcomes, which allows us to make better decisions.

Identifying Feedback Loops

Systems thinking helps us recognise the feedback loops in different areas of life, whether it's in personal finance, environmental sustainability, or organisational management.

By understanding how these loops work and where they exist, we can identify points where we can make strategic interventions to achieve our desired outcomes more effectively.
