

Through multiple improvements, the MVP becomes better by the final launch, reducing risks.

Have you seen the movie Padman, where Laxmi follows the “fail fast to fail-safe” concept? He creates affordable sanitary pads for women in rural India. Initially, he faced challenges as he tried to develop a low-cost sanitary pad solution.

Value v/s Time for Perfect MVP : Value v/s Time for Imperfect MVP

However, instead of waiting for a perfect solution, he decides to take action and give it to his wife to test, despite knowing it's not flawless. However, he receives the feedback of discomfort and leakages. He tried again and again, experimenting with different materials. Each new version of the sanitary pads came with lessons learned from previous failures, leading to gradual improvements in quality and usability. This eventually led to his success. It shows how launching early and improving based on real feedback can help you build a better product faster.

The Lean Startup Model

The Lean Startup Model, was first proposed in 2008 by Eric Ries, is a methodology for developing products and services efficiently. It helps entrepreneurs build a product that meets customer needs with minimal waste of time and resources. Instead of striving for perfection from the start, businesses focus on launching a Minimum Viable Product (MVP)—a basic version of the product—quickly.

This approach accelerates customer feedback, allowing businesses to iterate and improve based on real user insights. By continuously refining the product, companies save time, minimize risk, and ensure they build something that customers truly want.

Key Principles of the Lean Startup Model

- Speed Matters – Develop and launch products quickly.
- Start Small, Improve Fast – Begin with an MVP rather than waiting for perfection.
- Iterate and Adapt – Use feedback loops to refine the product continuously.

The cycle of MVP > Customer > Feedback > Improvement ensures a customer-driven approach to innovation, reducing waste and increasing the chances of success.
