

It has three phases:

Rapid Prototyping and Building an MVP

1. Start with a Prototype

Have you ever seen the plans of building construction created by software? Here, you can't build a building without a blueprint or any visuals, and similarly, you can't create products or services without a clear idea.

A prototype is like a rough design or a test version of a product, service, or process. It's not the final version, but rather a simplified version that helps to see how things might work in real life and make improvements and changes based on the feedback received. This helps ensure you're on the right track before you invest too much time and resources into building the final product.

These prototypes can be of two types: physical, like a mock product, and digital, like software. Prototypes can help you gather feedback, identify potential issues, and refine your ideas early on – saving time and resources in the long run.

2. Focus on Main Functionality

Here, you should consider the most important parts of your solution. The ones that really solve the biggest problem and make you different from your competitors. You should focus on the features or aspects of the product or service that address the main issues people are facing and create solutions for those that give you a competitive advantage.

In this way, you deliver real value to your customers, solving their problems and setting yourself apart from the competition.
