

By analyzing these metrics, you can gain valuable insights into how well your product is performing and identify areas for improvement based on customer interactions.

4. Analysis

After collecting feedback from your customers, it is important to thoroughly understand the gaps in your MVP. This analysis involves carefully reviewing the feedback, patterns, or areas of concern.

Learning

Learning from customer feedback involves pivoting and making iterations to your product based on the analysis.

Pivots mean making big changes to your product, while iteration refers to making smaller changes to your product to better meet the needs and preferences of your customers. Based on the feedback, you should decide whether to iterate the same path or change it. The idea of 'Fail Fast, Fail Safe' means that by launching your product multiple times and learning from each iteration, you can quickly identify and address gaps, inefficiencies, and evolving customer needs.
