

investment strategy, and have an ability to explain their approach in one sentence.

Are Experts Worthless?

To be clear: We are not making the claim that human experts are worthless across all aspects of the decision-making process. Dentists are great at filling cavities, surgeons are quite handy at repairing ACLs, and the right financial advisor can protect us from making expensive mistakes. Experts are critical, but only for certain elements of the decision-making process. To better frame the decision-making problem, we break the decision-making process into three components (see [Figure 1.3](#)):

- Research and development (build systems)
- Systematic implementation (implement systems)
- Evidence-based assessment (assess systems)
