

Our brains immediately think, “Staying alive or dying?—that's an easy question. I choose staying alive.” Of course, we have to strain a bit to realize that the two propositions are exactly the same.

One doesn't have to think too hard to see how a financial advisor with training in psychology could influence her customers. Consider once again the financial advisor we discussed earlier, who tells her client the following:

“Stocks are better for the long run because they earned 9.91 percent a year from 1927 through 2013.”

Take that same financial advisor, but have her frame the information a bit differently:

“Stocks are better for the long run because they grew \$100 into \$371,452 from 1927 through 2013.”

This same advisor frames the information in a chart, shown in [Figure 3.5](#).
