

Figure 3.8 Perceived Guilt by Time of Day

Overconfidence

Overconfidence, or the inability to appropriately calibrate our forecasts, is often cited as among the most robust empirical finding in psychology experiments.

Let's try a game.

Spend a couple of minutes identifying a low- and high-value answers to the questions in [Table 3.1](#), such that you are 90 percent confident the answer lies in between your upper and lower bound. To be clear, answering “negative infinity” and “positive infinity,” while clever, is missing the point of the game. You want to calibrate your upper and lower bound appropriately: not too cold, not too hot—just right. Go for it.
