

*Proposals*, no. 55, January 2016 [Online serial], <https://eips.ethereum.org/EIPS/eip-55>.

6. Registry contracts and interfaces allow a smart contract on chain to determine if another contract it interacts with is implementing the intended interface. For example, a contract may register itself as being able to handle specific ERC-20 tokens if unable to handle all ERC-20 tokens. Sending contracts can verify that the recipient does support ERC-20 tokens as a precondition for clearing the transfer. EIP-165 proposes a standard solution in which each contract declares which interfaces they implement. See Christian Reitwießner et al., “EIP-165: ERC-165 Standard Interface Detection,” *Ethereum Improvement Proposals*, no. 165, January 2018 [Online serial], <https://eips.ethereum.org/EIPS/eip-165>.

## CHAPTER VI

1. Many DeFi resources are available. For example, see <https://defipulse.com/defi-list/> and <https://github.com/ong/awesome-decentralized-finance>. We do not cover all applications. For example, insurance is a growing area in DeFi that offers to reinvent traditional insurance markets.
2. Stellar, *Stellar Development Foundation*, 2021, <https://www.stellar.org/>; EOS, Block.one, 2021, <https://eos.io/>.
3. Polkadot, Web3 Foundation, 2021, <https://polkadot.network/>.
4. MakerDAO, <https://makerdao.com>.
