

EXERCISE

Task: Experimenting with the Complete Mode

In this task, you will explore **temperature**, **length**, and **probability settings** to see how they affect responses.

Step 1: Generate a Response at Default Settings

1. Open OpenAI Playground (paid) or you may also go to Together AI (they give you a free credit of 1 USD, you may find similar hyperparameters to play with) and select **Complete mode**.
2. Use the following prompt:
3. “Explain the concept of Artificial Intelligence in simple terms.”
4. Keep the **default temperature (1.0)**, **max length (256)**, and **top P (0.5)**.
5. Generate the response and **note the style and creativity**.

Step 2: Adjust the Parameters and Compare

Now, change the following settings one at a time and observe how the response differs:

1. **Lower the temperature to 0.2** (Does the response become more factual?)
2. **Increase the temperature to 1.5** (Does the response become more creative but less accurate?)
3. **Set max length to 100** (Does the response become more concise?)
4. **Increase top P to 0.9** (Does the content become more diverse?)

Reflection:

How do these settings influence the way ChatGPT generates responses?
