

Understanding ChatGPT

6.1 What is ChatGPT?

ChatGPT is an artificial intelligence (AI) model developed by OpenAI and was released on 30th November 2022.^[1] The GPT in ChatGPT stands for 'Generative Pre-trained Transformer.' As the name suggests, it belongs to a class of models known as transformers. Ashish Vaswani, and other AI researchers who were part of Google introduced the idea of transformer models.

Transformer models are neural network architectures that revolutionise natural language processing (NLP), the field of machine learning that teaches machines how to interpret and write human languages. Their capabilities include almost instant translation of text and speech.

Transformer models must be trained on massive amounts of data to produce reasonable results. ChatGPT, too, is trained on data from various sources. This allows ChatGPT to understand and generate human-like responses to text inputs. The training process largely involves language modelling, i.e. predicting the next word in a sequence given the preceding words.
