

This training equips ChatGPT with a deep understanding of language patterns, semantics, and context.

NLP, as a field, has been around since the 1940s.^[2] However, only with the arrival of ChatGPT did we succeed in building a model that could generate coherent and contextually relevant responses to a wide range of prompts. ChatGPT can engage in conversations, answer questions, provide explanations, generate creative content like stories and poems, and even be used for research purposes.

We can interact with ChatGPT by providing text prompts, and in return, it will generate responses based on its learned knowledge and understanding of language. ChatGPT aims to provide helpful and relevant responses tailored to the user's input, whether assisting with tasks, providing information, or engaging in casual conversation.
