

For instance, a user would simply have to ask a personal assistant powered by ChatGPT to schedule meetings, set reminders for completing important tasks, or even see real-time updates in their agenda. If the personal assistant can facilitate web scraping, a user could set up an alert for when the Indian cricket team has reached a certain score or a stock has hit a certain price.

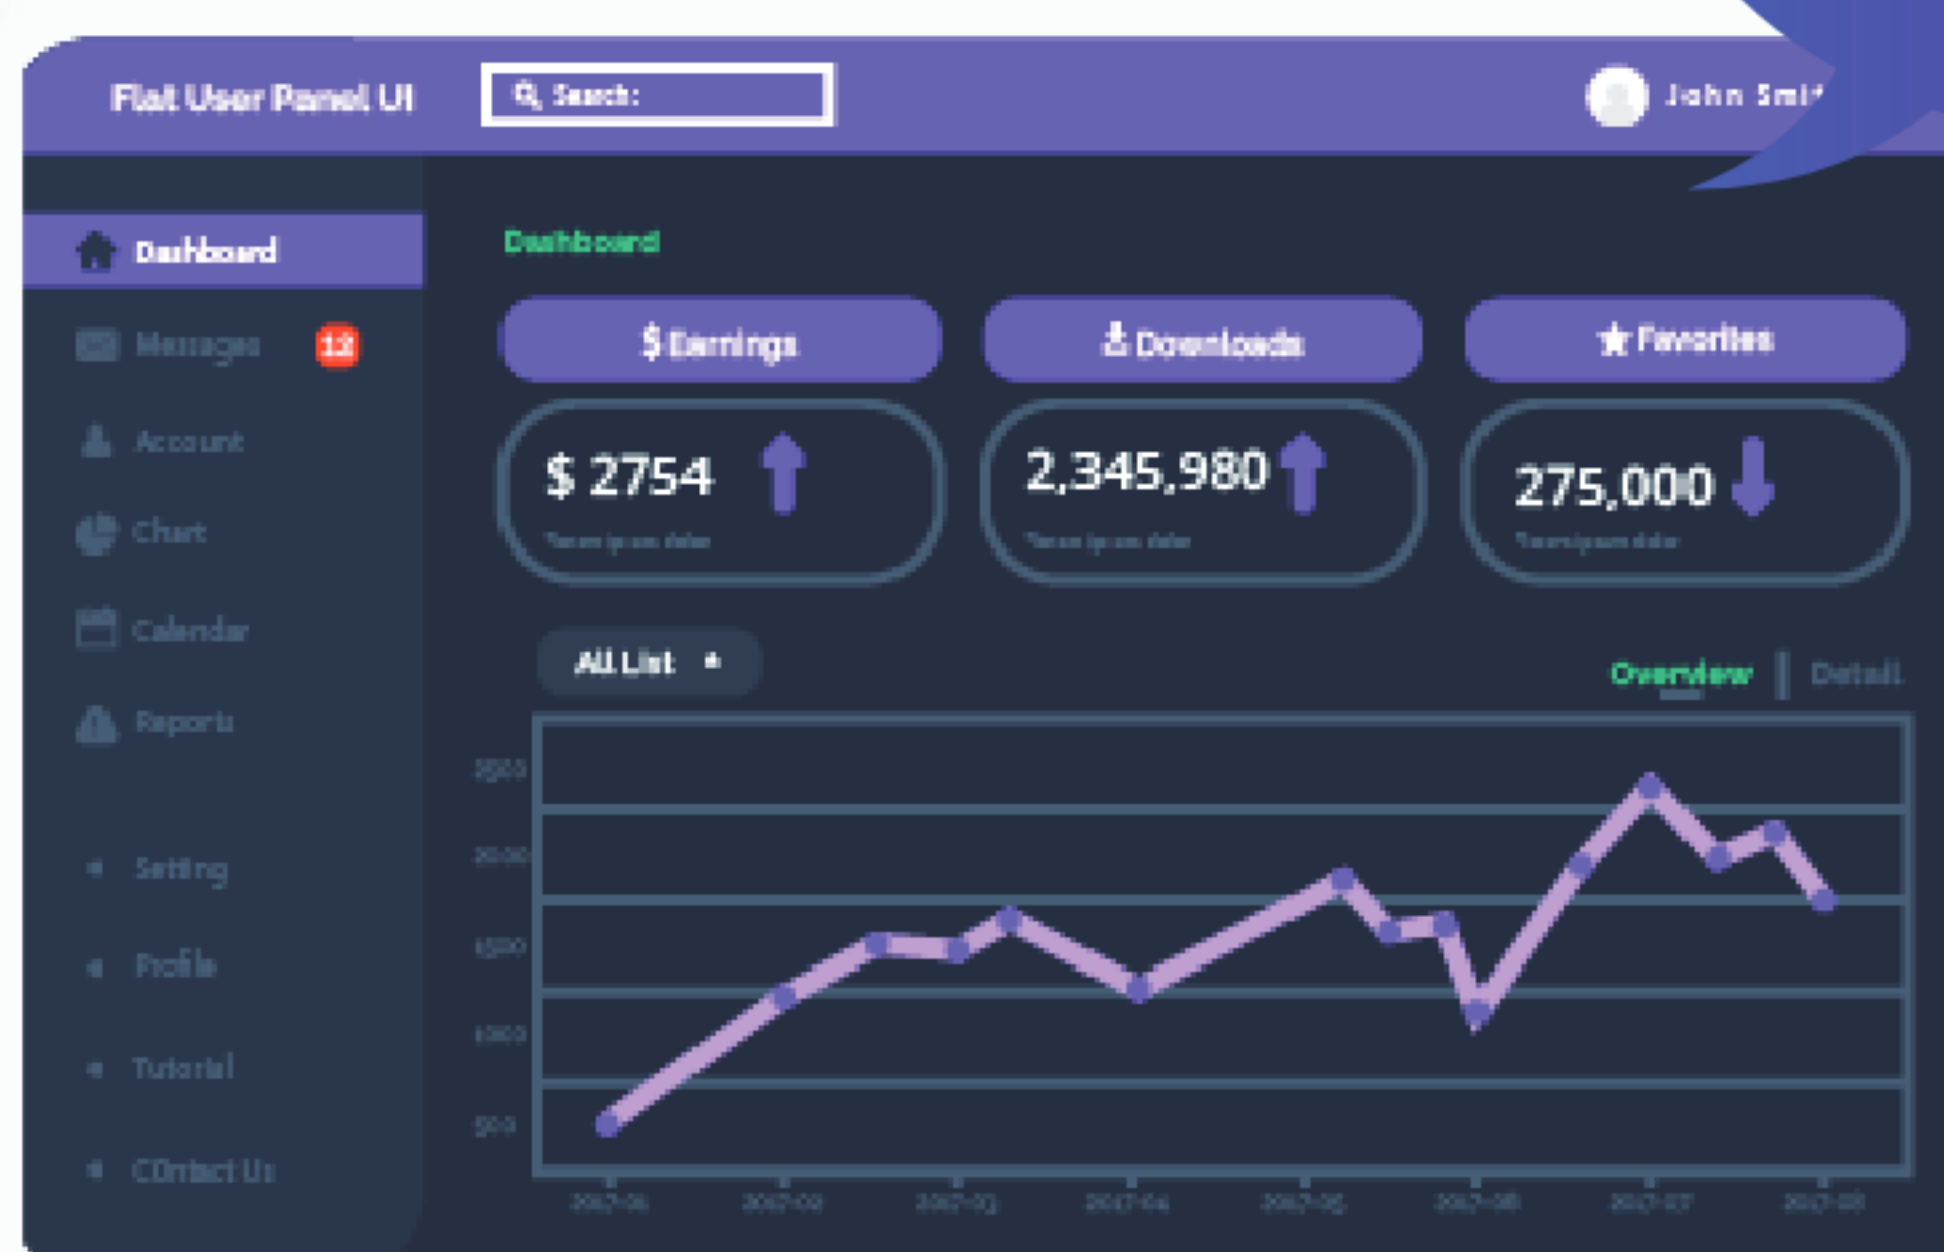

Users could also ask personal assistants to make suggestions based on the weather and other conditions, like 'carry an umbrella since there is a chance of rain' or 'use your bike instead of your car since traffic is unusually high for most routes.'

Thus, personal assistants can transform into a versatile tool with ChatGPT.
