

7.1 Zero-Shot Learning

7.1.1 What is Zero-Shot Learning?

Zero-shot learning is when an AI model is prompted to perform a task without examples, hoping it will understand the request and appropriately respond. It simply means asking a model to respond to a query or perform a task for which it has not been explicitly trained.

Applying the technique of zero-shot learning is much like asking a seasoned chef to reproduce a recipe they have never seen before. A good chef is armed with exquisite taste buds. By tasting a small portion, they will know the main ingredients and cooking processes involved in cooking that recipe. Then, based on the knowledge of cooking techniques, ingredients, and flavour profiles, the chef will try to reproduce the recipe. Recreation of the recipe is solely based on the instructions and the chef's knowledge.

Understands The Request And Appropriately Responds
