

7.1.2 When to use Zero-Shot Learning?

You need to use zero-shot learning when you do not have much training data, so you cannot provide examples. You will give basic instructions to ChatGPT and nothing else. Zero-shot learning may be helpful when you want the model to demonstrate general knowledge of some subject matter. It comes in handy when providing examples for every possible task is quite impractical.

In the analogy, you could trust the chef to reproduce the recipe due to their previous training. You cannot assume an engineer can do this. Thus, you can only use zero-shot learning if you believe ChatGPT or any other LLM you might use has built up knowledge on the topic.

Example

Now, prompt ChatGPT with the following.

ChatGPT

Prompt

Translate this paragraph from English to French: 'The quick brown fox jumps over the lazy dog.' Then, ChatGPT will give us the following response.

Response

Le renard brun rapide saute par-dessus le chien paresseux.
