

You could use ChatGPT to translate the text here since it has undergone training. Examples were not required to be shared. In the context of translation, examples would be translations of a few words in the paragraph, such as quick means rapide and brown means brun in French. However, ChatGPT has already been trained for this.

Zero-shot learning leverages the model’s ability to generalise from its training data to novel situations. This technique is particularly valuable in real-world applications where data can be scarce, or tasks are highly variable.

For instance, in healthcare, zero-shot learning can enable AI systems to interpret and respond to new medical queries based on their understanding of related medical knowledge.

Consider a more complex example of translating legal jargon. Let’s take the example of one of the paragraphs of the Indian legal rental agreement.^[1]

The paragraph you want to translate is:

Prompt and response

Zero Shot Prompting

Can you translate this legalese into layman language?

That the Lessor at this moment grant to the Lessee the right to enter into and use and remain in the said premises along with the existing fixtures and fittings listed in Annexure 1 to this Agreement and that the Lessee shall be entitled to peacefully possess, and enjoy possession of the said premises, and the other rights herein.

Response

Sure! In simple terms, this means:

"The landlord is giving the tenant the right to enter, use, and stay in the property, including the fixtures and fittings mentioned in Annexure 1. The tenant has the right to peacefully live in and use the property as agreed in this contract."

Zero-shot learning translates complex texts without specific examples

This demonstrates the model’s ability to handle specialised language and produce understandable translations without specific prior examples.
