

Example

ChatGPT

Prompt

Complete the following analogy: 'Apple is to fruit as carrot is to ----.'

Example: bananas and fruits; broccoli and vegetables."

Response

Vegetable.

Few-shot learning builds on the strengths of zero-shot learning, which relies completely on the model's prior training. Here, in addition to the prior training, the model is given some minimal context to enhance its performance on specific tasks.

Few-shot learning can be invaluable in tasks where personalisation is required. For instance, ChatGPT could generate a new question bank to boost a student's abilities if you share their previous work. Based on this example, ChatGPT could generate a question bank to bolster students' strengths and help them cover their weaknesses.

Digital marketers can use few-shot learning to generate personalised ad copies. You could share examples of successful ad campaigns whose style elements you like best. Then, the model will create new compelling advertisements that resonate with the target audience.

Suppose you liked Amazon's Marvelous Mile Campaign for its show, The Marvelous Mrs. Maisel, and want something similar for your retro show. ChatGPT could then suggest a similar marketing campaign.
