

7.5.3 Example

In the next example, you will see how ChatGPT can generate a fresh hypothesis on the impact of climate change on global biodiversity.

You can use this prompt:

In return, you will receive this response:

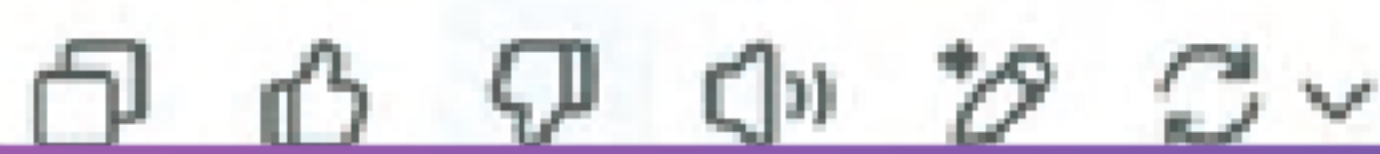

Generated Knowledge Prompting

Propose a hypothesis about the impact of climate change on global biodiversity.

Response

Hypothesis: *Climate change is accelerating the loss of global biodiversity by altering habitats, disrupting ecosystems, and increasing the frequency of extreme weather events, leading to species extinction and reduced genetic diversity.*

Generated knowledge prompting creates original insights based on existing information

The model used its understanding of climate science and ecological principles to hypothesise the relationship between climate change and biodiversity.

Another example of generated knowledge prompting proving useful would be asking a model to propose new insights into animal migration patterns based on climate change data. Such insights are invaluable for ecologists.

Digital marketers could use this technique to generate fresh ideas for articles, stories, or marketing campaigns. You could prompt a model to “:

If you did so on ChatGPT, you would get the following response.
