

Organisations could anticipate market trends and develop appropriate strategies. For instance, LLMs could generate various branches of possible outcomes arising out of an organisation entering a new market.

These branches could explore potential customer responses, competitive reactions, and financial implications, helping the company develop a robust market entry strategy.

Authors can use ToT to develop complex, multi-threaded narratives. Authors can create more engaging stories by exploring different plotlines and character arcs. For instance, an AI model might help an author explore various endings to a mystery novel, considering different paths the story could take based on key plot decisions.

7.7 Prompting Frameworks

Prompting frameworks are rules and guidelines that enhance communication with artificial intelligence (AI). Like prompting techniques, these frameworks are meant to help you get the response you seek. However, instead of focusing on a single prompt, prompting frameworks govern your interaction with the LLM model.

Let's explore some of the most effective prompting frameworks.

7.7.1 CFBR

CFBR stands for challenges, frustration, benefits, and results and is not for commenting for better reach. This framework can help you get more comprehensive responses from AI models like ChatGPT. Think of it like warming up before a workout. Just like you must prepare your muscles, you must give the AI context and build up to the final answer.

For example, if you're writing an article about buying a house, you can start by asking about the challenges a first-time buyer might face. Then, you could ask the AI to elaborate on the frustrations experienced by people who've rented all their lives.
