

8.1.4 Time Efficiency

The fine-tuning approach reduces the time required to achieve high performance on specific tasks since the base model already has a robust understanding of language. If you start training an LLM from scratch, the model must first understand the human languages. Then, you must train the model on basic information about your field. Once you finish this, you can train the model on the specific dataset that interests you. This is a very unnecessarily lengthy process.

Instead, you could simply ask ChatGPT to forget everything except human language and its protocols to search the web and analyse information. Then, you could train ChatGPT on the information of interest to you.

Starting from Scratch takes time

Fine-tuning results in smarter and faster models
