

What do you mean when you say that the data must be labelled?

In machine learning, you have supervised learning and unsupervised learning. Supervised learning involves training a model on a dataset where input variables and their outcomes are presented. Unsupervised learning only provides inputs and expects the model to find hidden patterns.

Labelling is the difference between these two approaches. Given a particular set of inputs, it tells the model what the expected output would be. If you are not relying on ChatGPT to uncover any hidden patterns, it makes sense to label your data.
