

Raw Data

Non-Uniform
Data

Unsplitted
Data

2

Tokenisation – Break Down
the Text into Manageable Pieces

Tokenisation converts raw text into a structured format that the model can understand, allowing it to process and learn from the individual components of the data.

4

Data Splitting – Divide the Dataset into
Separate Subsets for Training and Validation

The training set trains the model, while the validation set evaluates its performance and helps tune the parameters. This split ensures the model is tested on unseen data, providing a more accurate measure of its effectiveness.

Standardised
Text

Subset for
Training and
Validation

By meticulously preprocessing your data, you set a solid foundation for effective fine-tuning, ultimately leading to better model performance and reliability.
