

8.3.6 Evaluation

After completing the training process, it is crucial to thoroughly evaluate the fine-tuned model to ensure it performs well on unseen data. You can do so by:

- Test the performance of the validation set you created in the previous steps.
- Applying various metrics like accuracy, perplexity, and task-specific metrics to gauge improvement.

This will help you identify areas for improvement. You can tweak the parameters or present additional data to improve the accuracy.

8.3.6 Deployment

Once your model is performing well, it's time to deploy it into your application, like ChatGPT. Make sure it's set up on servers that can handle its needs. Keep an eye on how it's doing by setting up monitoring systems to track performance metrics, log any errors, and get feedback from users. If you spot any issues or areas for improvement, adjust or update the model accordingly to keep it running smoothly and effectively.
