

8.3.8 Continuous improvement

To keep your model in top shape, make it a habit to continuously gather new data and feedback on how it performs. This ongoing process helps you spot areas where the model might need tweaks or updates. Regularly updating and refining the model based on this fresh information ensures that it stays relevant and practical, adapting to any changes or new patterns that emerge over time.

8.4 Conclusion

To summarise, fine-tuning is akin to tailoring your suit instead of buying one from the store. It involves taking pre-trained LLMs and training them on your dataset. As a result, you will have created a custom LLM capable of meeting your specific needs.

An alternative to fine-tuning that you can consider is retrieval-augmented generation (RAG) if you feel that the authoritative online sources used by ChatGPT are accurate, relevant, and detailed enough for your purposes.

By adopting a systematic approach to fine-tuning, your organisation can truly maximise the potential of ChatGPT for specialised applications. So, go on, try this out for yourself!
