

The advantage here is that ChatGPT remembers your previous work patterns within the same chat, which means it can suggest tasks that align with your current projects or past habits. This historical context allows ChatGPT to create a more cohesive plan, even automatically incorporating specific projects, client follow-ups, or strategic work.

You can also use ChatGPT to create a work plan without any prior context. Let's see how.

First, open a new chat on ChatGPT and enter this prompt: 'I wish to work on some training content development for week 1 and also record my course on Generative AI. Can you help me with a weekly plan balancing professional and personal life for October 1st week?'

With this prompt, ChatGPT quickly produces a well-rounded plan. For example, it suggests beginning October 1st with a morning block dedicated to content development and recording the first course module. It includes a break in the afternoon for family time and light exercise, then schedules an evening review session for refining recorded materials.

Prompt ChatGPT with adjustments, and it will update the schedule

ChatGPT's updated draft schedule

you help me with weekly plan balancing professional and personal life for October 1st week
