

So far, it has been demonstrated how to work around the following limitations that mentioned earlier:

- Search the internet
- Crawl a website and get data
- Perform research

Now, let's see how to work around the limitation of ChatGPT being able to answer questions based on data submitted by the user. You will do so by installing another Chrome extension. If you want to upload text data, you can do so by simply copy-pasting it into the prompt. You might remember this from a previous chapter when you uploaded a document by copy-pasting the text it contained.

However, this chapter will explore how ChatGPT File Uploader can help upload various files.

As you can see from the thumbnails, this extension allows you to upload data saved in CSV, JS and PY formats in addition to text data. After installing this extension, you will see a submit file button in the bottom right corner. Before uploading the data, you removed the other extension used in this chapter.
