

The extension splits the data into smaller packets and keeps uploading them one by one. This extension knows ChatGPT's file chunking limit and the word limit for prompts. ChatGPT cannot take more than 4,000 tokens or approximately 3,000 words. So, the extension breaks up the file into parts and starts uploading them when you click the submit button.

So now, this chat window understands the context of the entire document. You did not have to do this manually. The extension did this automatically.

Now, let's move on to a summary. When you did so, you got the following response.

ChatGPT
Of course! The technical white paper discusses the architecture, deployment options, and implications of transitioning from 4G to 5G networks. Here's a summary:

1. **5G Architecture Options:** The paper outlines two main architecture options: Standalone (SA) and Non-Standalone (NSA). SA involves deploying both the 5G Core (5GC) and New Radio (NR), providing full 5G capabilities. NSA, on the other hand, initially relies on LTE infrastructure and introduces NR later.
2. **Migration Paths:** It details different migration paths from LTE to 5G, including options like NSA Phase 3, NSA Phase 4, and eventually transitioning to SA. Each option has its benefits and challenges, with SA offering full 5G services but requiring more upfront investment.
3. **Coverage and Latency:** The paper discusses factors affecting coverage, like frequency bands, and

compares latency between SA and NSA architectures. SA typically offers lower latency due to streamlined signaling procedures.

4. **Voice Services:** It covers Voice over New Radio (VoNR) for 5G SA networks, similar to VoLTE in 4G, and fallback mechanisms for ensuring continuous voice service during transitions.
5. **Deployment Considerations:** The document emphasizes the importance of band utilization, advanced technologies like Massive MIMO, and considering various deployment scenarios based on urban density and coverage needs.
6. **Business Opportunities:** Lastly, it highlights the potential for innovative use cases enabled by 5G, such as factory automation and smart cities, which can create new revenue streams for operators.

Overall, the white paper provides a comprehensive overview of 5G architecture, migration strategies,
