

Other AI Tools

In this chapter, let’s discuss the different tools you can use to increase your productivity using artificial intelligence (AI). You first understand the domains of these tools and then understand how to use them. Let’s first go over that definition to build some context.

Gen AI is basically a type of artificial intelligence that can help you design new content, including text, images, videos, and voices. Gen AI can also do a lot of things, including code generation.

With that in mind, let’s deep dive and understand tools other than ChatGPT, Gemini, or Bing that can help you use generative AI to the fullest potential. At the start of this book, you mainly learned about text-to-text generative AI tools. But there are three other types:

Type	Function
Text-to-text	Takes text as input and gives text as output
Text-to-image	Takes text as input and gives an image as output
Text-to-voice	Takes text as input and gives voice as output
Text-to-video	Takes text as input and gives video as output
