

Image generation through AI is a very versatile offering that is useful across verticals such as marketing, design, e-commerce, and personal projects. You can use AI image generation tools to create social media posts, presentations, email marketing assets, or even things like wedding invitations.

Now, Let's look at some Challenges of using AI in Image Generation.

Like with any technology, there is a trade-off between speed and quality in AI image generation. Typically, no two AI-generated images are the same. However, copyright issues over who owns a particular AI-generated image can arise. Typically, the AI image generation tool will own the image. They will not pass on the image rights to you. Hence, you must be very careful about using AI images.

AI image generation tools can also have biases, such as not being able to generate Indian faces because of a lack of depth and diversity in the dataset on which the model was trained.

AI images can also be misused in the form of deepfakes and unauthorised use of AI-generated images that give rise to legality concerns.

Therefore, you must use AI-generated images very carefully.
