

All the machine is doing in this case is discriminating between two objects and trying to label them as cats and dogs.

Then, someone had the thought that if machines can discriminate between the two, why can't they generate a picture of a cat or a dog from scratch? This was the birth of generative AI.

GENERATIVE MODEL

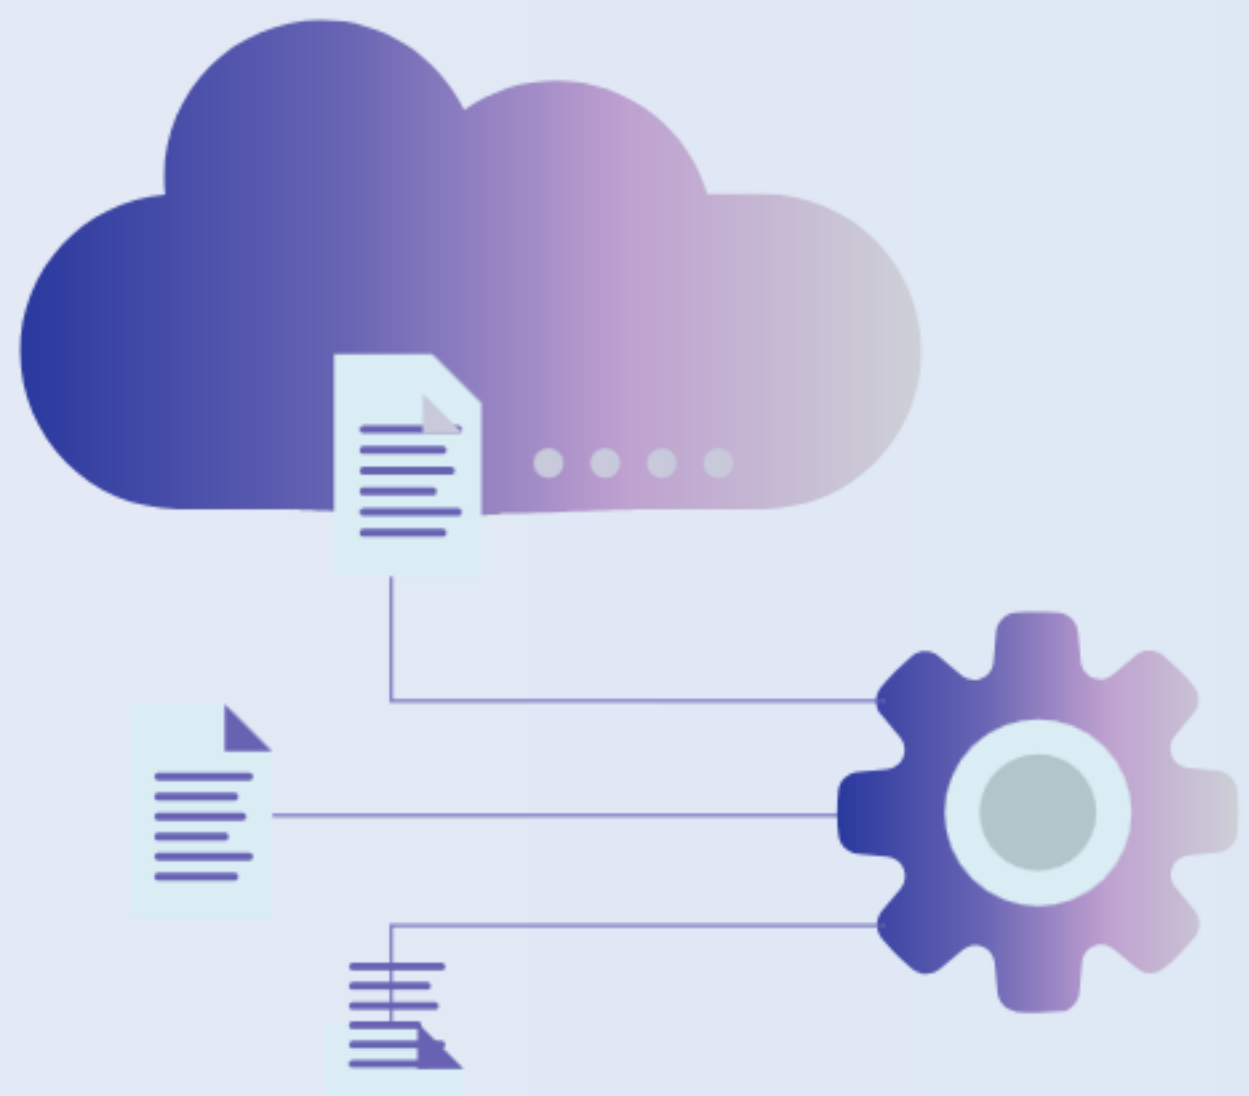

Create an Image of Dog Drinking Juice And Cat Looking At The Dog

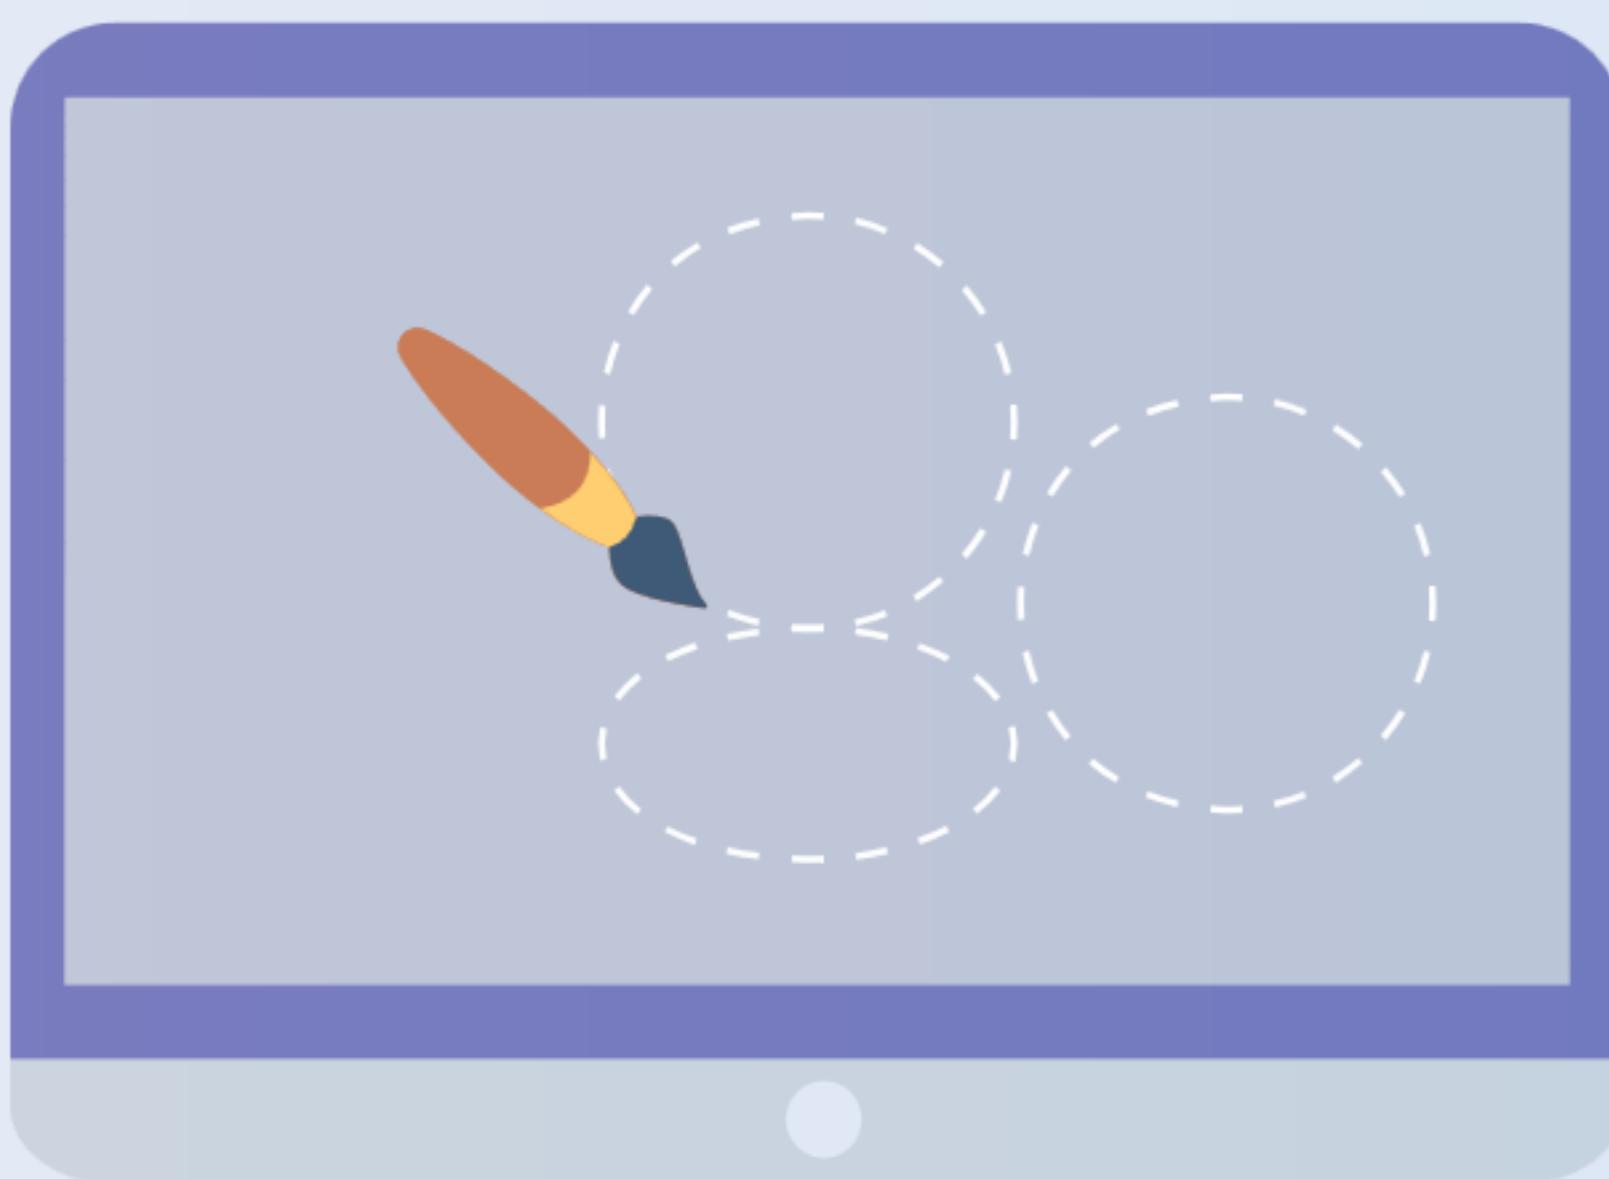

Cat

Dog

Model is Learning the Features of Dog and Cat

Synthesis of images

Generative AI has reached a stage where we cannot tell if the images are of a real cat or an AI-generated cat both the following images are AI-generated.

Generative AI is changing companies by providing digital art, massive dataset research, and realistic human-like voices. Generative AI can answer most of the questions you ask because it has been trained on vast amounts of data available on the internet.
