

11.2.6 Tensor.Art

Tensor.Art is a tool that supports multiple AI models for image generation. It operates much like Stable Diffusion in the text-to-image domain. Still, it includes unique models, such as Flux, a recently launched model known for creating some of the most realistic images available that also include text. Tensor.Art’s creators previously worked on Stable Diffusion, and their expertise shows in the realism of the images it produces.

Tensor.Art provides various model options to suit different styles, including Flux, Colours, Table 3D, S3 Universal, Winterwave, Line Art, and Sketchup. Each model renders images according to its specific style, so choosing a model like Flux yields hyper-realistic results.
