

11.3 Text-to-voice

In this section, let’s explain how you can generate realistic voiceovers using AI. Text-to-voice is a technology which converts text into spoken audio. It is very commonly used in virtual assistants.

For example, Google Assistant, Siri or even Alexa. These are all virtual assistants based on text-to-voice technology. All of them try to speak to you. That’s why the technology is called text-to-voice. In fact, other use cases of this can be audiobook narrations or in fact, accessibility tools for the visually impaired.
