

Let's go to ChatGPT and generate the text. You will just be asked to put in a prompt saying, 'What is generative AI?'

Since you are just trying to test the tool, just copy a small paragraph to get started.

What is generative AI?

Copy a small paragraph

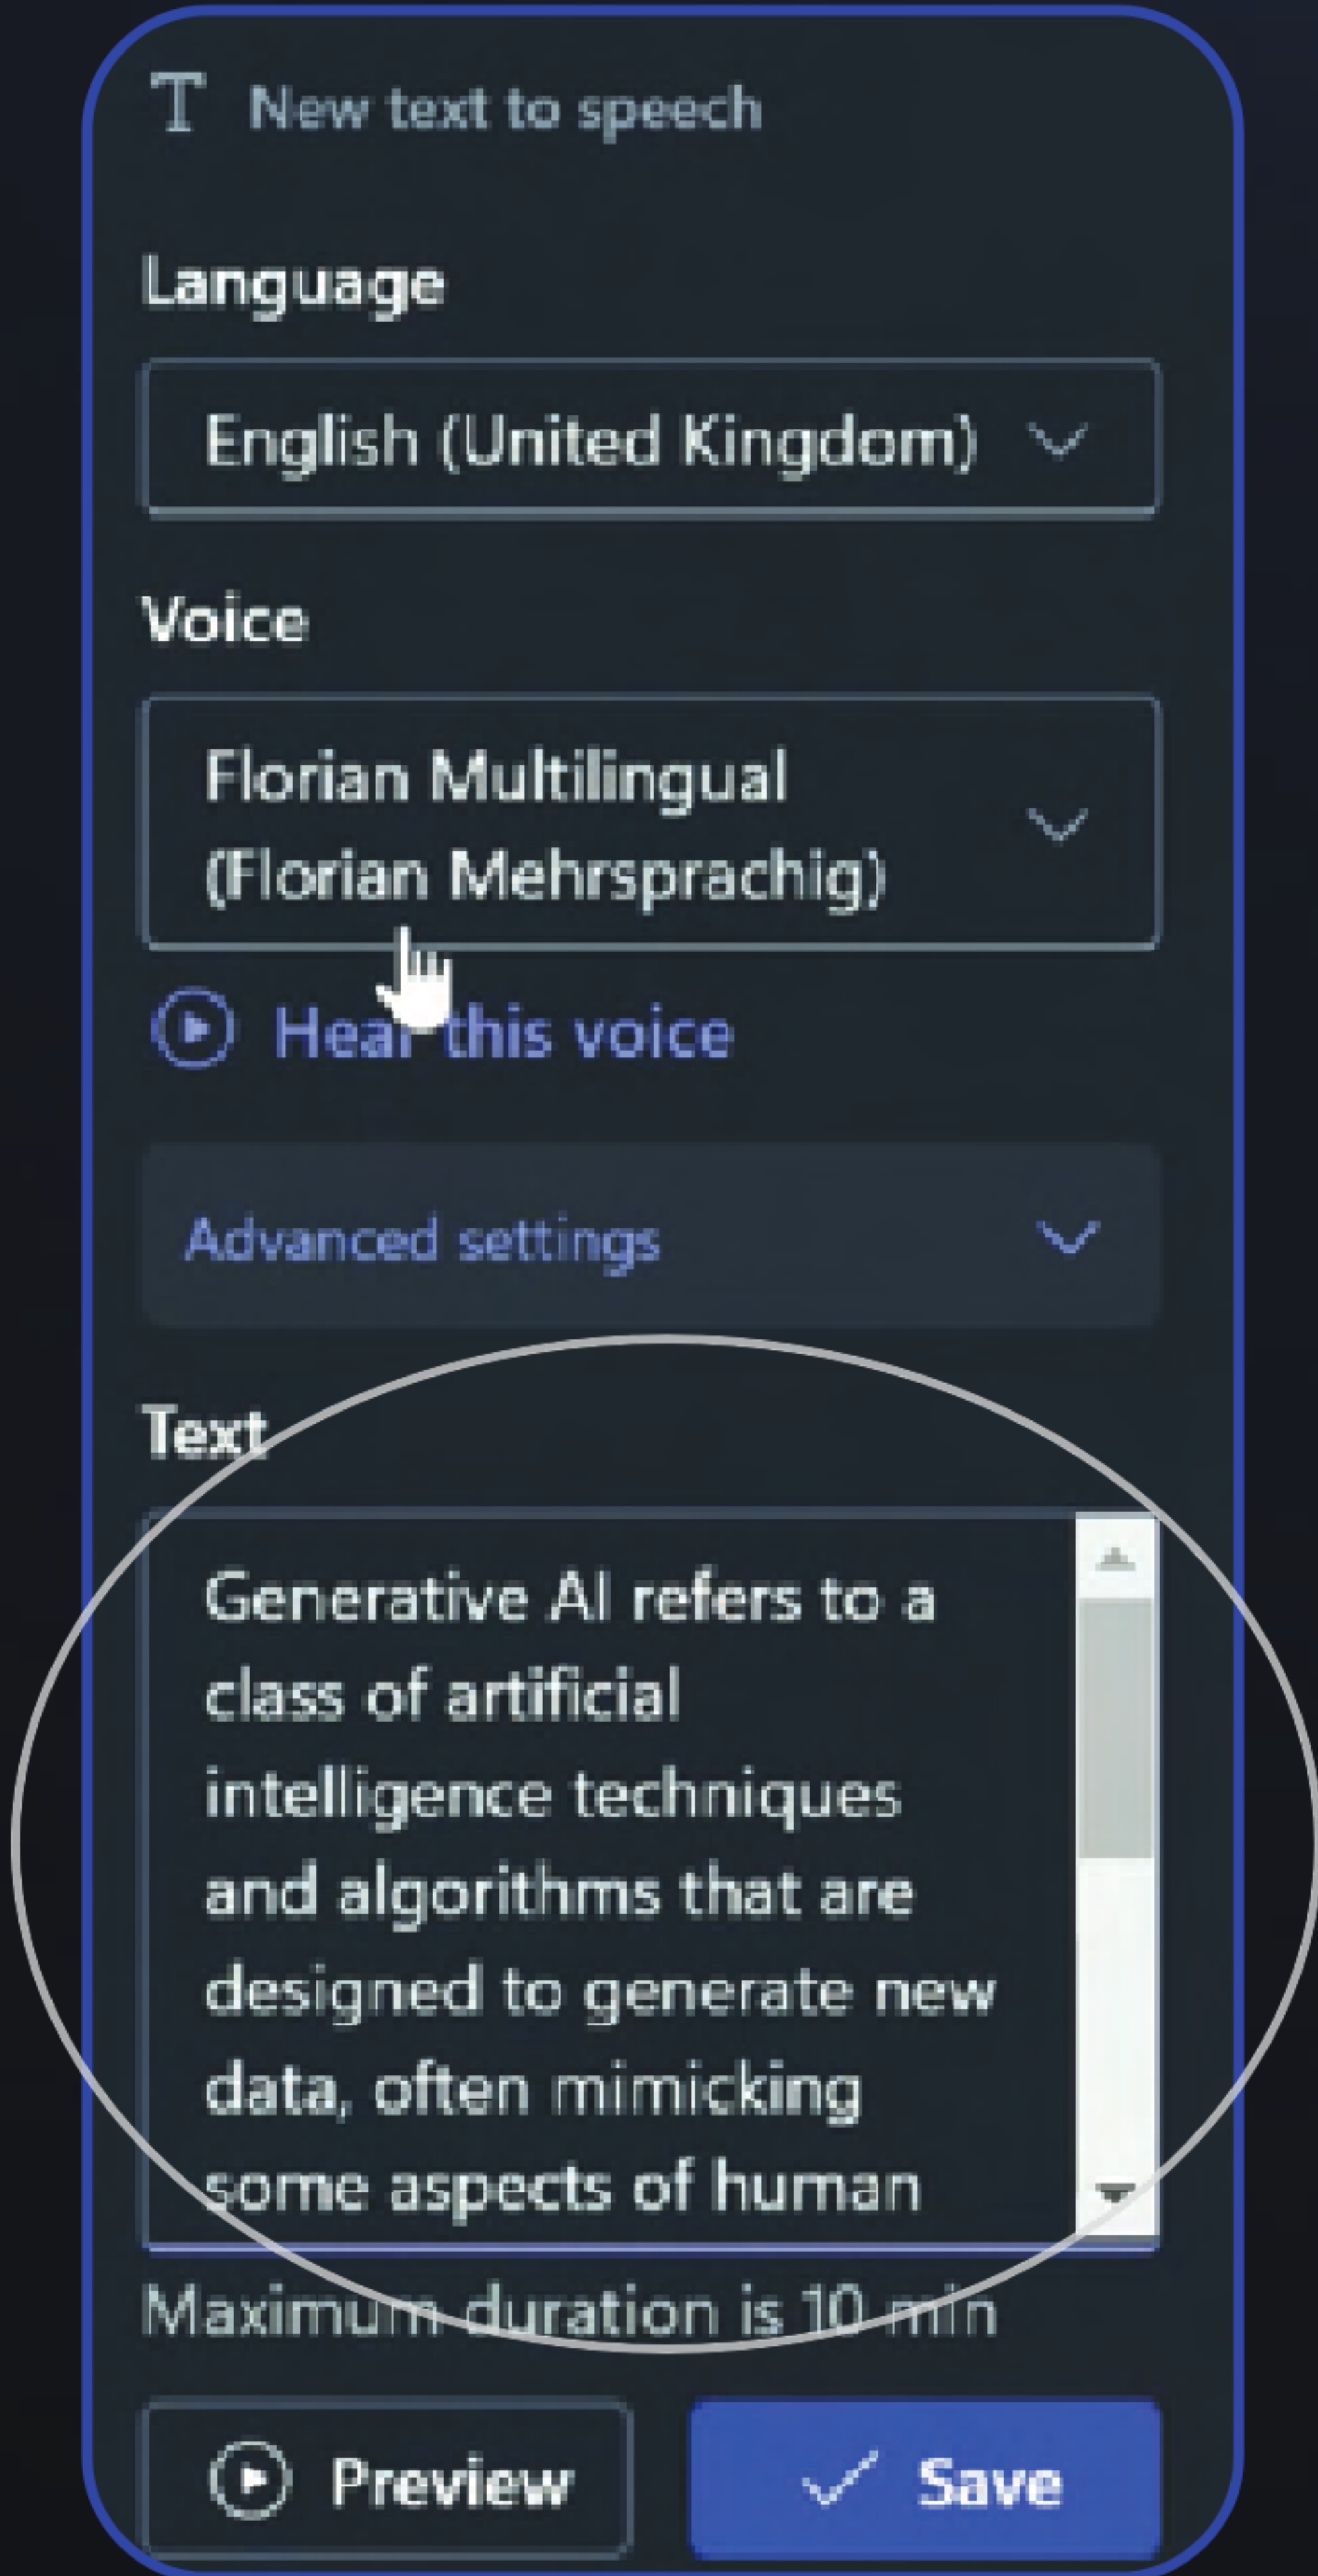

ChatGPT.

Generative AI refers to a class of artificial intelligence techniques and algorithms that are designed to generate new data, often mimicking some aspects of human creativity. These systems learn patterns from a given dataset and then generate new data points or outputs that resemble the original data.

There are various approaches to generative AI, including:

1. **Generative Adversarial Networks (GANs):** GANs consist of two neural networks, a generator and a discriminator, which are trained simultaneously. The generator creates new data instances, while the discriminator tries to distinguish between real and generated data. Through this adversarial training process, the generator improves its ability to produce realistic data.

You have pasted the text here:

When you click on preview, you hear a voiceover that is fluent and pleasant to hear. It is recommended that you try this out for yourself so you can judge its abilities.

To you, the voiceover sounded very human.
