

The only fields where productive AI is employed are fashion, music composition, art and design, economic forecasting, customer behaviour analysis, health diagnostics, and fraud detection. These are just a few examples of the many industries utilising AI.

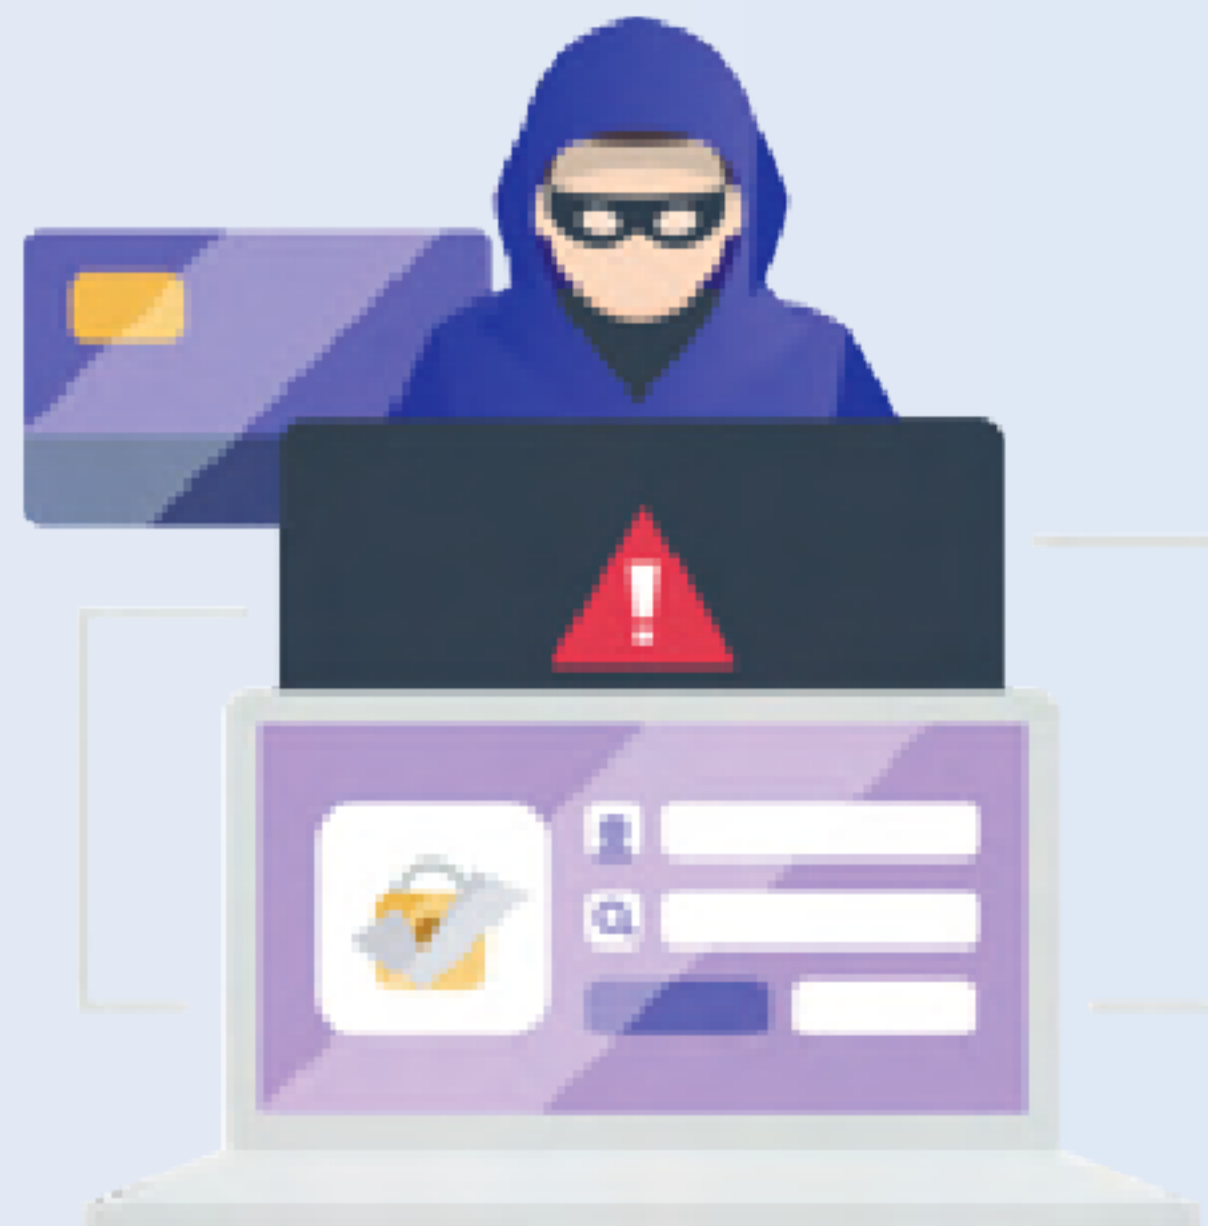

Demand Forecasting

Predicting prospective development markets is known as demand forecasting.

Financial Forecasting

Generative AI can forecast multiple-year cash flows based on the company's financial history and the expected economic outlook.

Fraud Detection

Fraud detection is the method of finding deceitful activity.

Health Diagnosis

Assisting in medical diagnostics.

Virtual World

Generative AI can diminish the difference between the real and the virtual world by writing code for Blender, 3D Maya or 3D Max. It can help you build a 3D avatar.
