

12.4 Building an Application on ChatGPT

Now, without any further ado, let's get over to ChatGPT and see whether you can build an application for ourselves.

Instead of writing the entire code on your own, ChatGPT started writing the code for the application based on its training. This is what its response looked like.

Prompt for Answering question

I want to build a Todo list app using HTML, JS and CSS. make the app functional and stylish

ChatGPT's Answer

ChatGPT

Creating a simple Todo list app with HTML, JavaScript, and CSS is a great way to learn more about web development! Here's a basic guide on how to build one. We'll start with a simple version that includes adding tasks, marking them as complete, and deleting them. I'll also include some basic styling to make it look nice.

1. HTML Structure

First, let's set up the HTML structure. This will include an input field for new tasks, a submit button, and a list to display the tasks.

```
html Copy code

<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <title>Todo List</title>
  <link rel="stylesheet" href="styles.css">
</head>
<body>
  <div class="todo-container">
    <h1>Todo List</h1>
    <input type="text" id="taskInput" placeholder="Add a new task">
    <button onclick="addTask()">Add Task</button>
    <ul id="tasksList"></ul>
  </div>
  <script src="app.js"></script>
</body>
</html>
```
