

When you add another input tag, it suggests adding a time input, which you accepted.

```
9   <body>
10   <div class="todo-container">
11     <h1>Todo List</h1>
12     <input type="text" id="taskInput" placeholder="Add a new task">
13     <input type="date" id="taskDate"> I
14     <input type="time" id="taskTime">
15     <button onclick="addTask()">Add Task</button>
16     <ul id="tasksList"></ul>
17   </div>
18   <script src="app.js"></script>
19 </body>
```

This tool understands the application's nature and how it can be improved. This tool even understands your perspective and predicts the changes you want. So, you don't need to switch back and forth between ChatGPT and Visual Basic. You can just use Copilot, and it will make suggestions based on what it thinks the next course of action should be.

It can understand code, reference thousands of publicly available codes and make suggestions after evaluating your code.

When you save the file and reload the browser tab, you will see the updated version.

This is how you can code at 10x the average speed. Hopefully, this was an interesting chapter for you. It has been recommended that you try out coding with the aid of AI, whether you are a software developer or not.
