

12.6 Best Practices While Coding with AI Tools

Some of the best practices while coding with AI tools are as follows:

12.6.1

Use AI as an Assistant, Not a Replacement

Firstly, you must consider these tools as an assistant to you rather than your replacement.

12.6.2

Define Prompts Clearly

You must learn the art of prompt engineering. If your prompt is very loose, it will generate a generic answer unsuited to your needs. For example, if you just ask these tools to build you a to-do list application. At this point, you have not specified which language to use, the purpose of this application, who will be using this application, or the elements you must have in the app.

12.6.3

Be Specific with Instructions

When you wanted to build such an application, you specified the languages and gave instructions to make it stylish and functional. You should not hold back such requirements from the AI tool. So, when you are giving instructions, you must be very specific.
