

12.6.4

Consider the AI's Training Data Limitations

With AI tools, there are limitations in terms of data storage. Let's say that you are working with a new library called LangChain, which is a new library for writing generative AI applications. These tools have not been trained on LangChain since the library is relatively new. Unfortunately, these tools cannot write code for you in such cases.

12.6.2

Review and Understand the Code

Instead of blindly trusting the code generated by AI, you must try to understand each component; otherwise, you will be unable to give further instructions on refining the code.

12.6.3

Test Extensively

It is very important to test extensively. Otherwise, your code will not work. Testing your code enables you to identify and rectify any errors. You can even leverage AI tools for testing.
