

12.7 Challenges with AI-assisted coding

Some of the challenges with AI-assisted coding are:

12.7.1 Data Privacy and Security Concerns

Sometimes, your employer might not allow you to prompt ChatGPT because of data privacy and security concerns. To address this problem, tools like GitHub, Copilot, and Codeium can be used because they reside within your IDE and work just as well.

Lock and Secure IDE

12.7.2 Code Quality and Reliability

Sometimes, quality can be an issue because these models have a slate. For example, when a security officer once prompted ChatGPT to create a code with an API key, it exposed the API key. The code was correct, but it exposed the API key. So, the code quality can be a question mark. Security concerns can arise if somebody is not reading these tools' code.
